

Alterei o IP do exercício (**192.168.10.1**) para o **192.168.1.50** porque o meu router em **VMware** utiliza a rede **192.168.1.x**. Esta mudança evitou conflitos de rede e garantiu que o **Ubuntu Budgie** e o **Server** comunicassem corretamente. Ao usar um IP estático na minha gama real, mantive a conectividade à internet e o acesso aos serviços DHCP, Apache.

The screenshot displays the Ubuntu Bugle web interface, which provides a centralized view of system health and configuration. The interface is organized into several sections:

- Header:** Includes a navigation bar with tabs for 'Overview', 'Logs', 'Storage', 'Networking', 'Accounts', 'Services', 'Tools', 'Applications', 'Software updates', and 'Terminal'. The current tab is 'Overview'.
- System Information:** Displays the hostname 'walde' and the operating system 'Ubuntu 24.04.3 LTS'.
- Health:** Shows the status of system services. A red indicator shows '1 service has failed', while a green indicator shows 'System is up to date'. It also displays the last successful login: 'Jan 22, 01:29 PM from 192.168.1.101 on ptty/2'.
- Usage:** Displays resource usage metrics. CPU usage is at 0% of 2 CPUs, and memory usage is at 0.49 / 1.7 GiB.
- System information:** Provides details about the hardware, including the model 'VMware, Inc. VMware Virtual Platform', machine ID 'c24d66d87e4e44beabf13d3f3', and uptime 'about 3 hours'.
- Configuration:** Shows system settings such as the hostname 'walde', system time 'Jan 22, 2026, 2:00 PM', domain 'Install realmd support', and performance profile 'none'.

The interface also includes a search bar and a 'Turn on administrative access' button, indicating that the current view is in limited access mode.
